

Interactive Voting System

About IVS:

IVS is developer and producer of the Interactive Voting System IVS. This system is developed for dedicated voting. Two hardware types are available for the system, IVS-RFII and IVS-Lite. All software is developed by Interactive Voting System too. The stand-alone versions that belong to the system offer lots of options to process and present the voting results.

Besides these stand-alone software versions we also have a plug-in in PowerPoint that allows easy types of voting.

Current situation:

IVS is a healthy company with a widely spread yet loyal group of customers. Among our clients are Audiovisual companies, that buy the system to rent it out, companies that organize shareholders meetings, Universities and schools for higher education, consultancies, insurance companies and banks (the latter often for Risk Analysis)

Description

The system that is available right now covers about 95% of our client's demands. Yet it gets a little outdated. It is for that reason that we are considering developing a complete new keypad based on the latest technologies.

Important demands:

- Ease of use (even 75 year old shareholders must be able to understand how it works)
- Fast and reliable transmission of data.
- ISM band license free
- Possible to use with groups up to 10.000 people (and still fast)
- Pricing

There are 3 fields/steps where we would like to have some input:

1. Brainstorm about possible technologies / options
2. Report after some deeper investigation about all options
3. When the outcome of the report is positive we would like to have support in realizing the keypad / system.
